Investment Objective: The Fund seeks long-term capital appreciation by investing in equity securities of issuers it believes are undervalued relative to their financial strength and upside potential.

Price/Book: price per share divided by book value per share. Price/Earnings: price per share divided by earnings per share. Price/Cash Flow: price per share divided by cash flow per share. Active Share: a measure of the percentage of stock holdings in a manager's portfolio that differ from the benchmark index. Standard Deviation: a measure of how much an investment's returns can vary from its average return. Weighted Average Market Cap: The weighted average capitalization of the companies based on total securities owned in the portfolio. Dividend Yield: calculated by annualizing the last quarterly dividend paid and dividing it by the current share price. The dividend yield is that of the securities held in the portfolio; it is not reflective of the yield distributed to shareholders.

1SEC 30-Day Yield: This calculation is based on a 30-day period ending on the last day of the month shown. It is computed by dividing the net investment income per share earned during the period by the maximum offering price per share on the last day of the period. The yield figure reflects the dividends and interest earned during the period, after the deduction of the fund expenses. A subsidized yield takes into consideration the expenses paid by the Advisor.

The MSCI World Index with net dividends captures large and mid cap representation of developed markets.

MSCI has not approved, reviewed or produced this report, makes no express or implied warranties or representations and is not liable whatsoever for any data in the report. You may not redistribute the MSCI data or use it as a basis for other indices or investment products.

The MSCI World Value Index with net dividends captures large and mid cap securities across developed market countries exhibiting value style characteristics, defined using book value to price, 12-month forward earnings to price, and dividend yield. The Index was launched on Dec 08, 1997. Data prior to the launch date is back-tested data (i.e. calculations of how the index might have performed over that time period had the index existed). There are frequently material differences between back-tested performance and actual results.

Because the values of the Fund's investments will fluctuate with market conditions, so will the value of your investment in the Fund. You could lose money on your investment in the Fund, or the Fund could underperform other investments. The values of the Fund's investments fluctuate in response to the activities of individual companies and general stock market and economic conditions. In addition, the performance of foreign securities depends on the political and economic environments and other overall economic conditions in the countries where the Fund invests. Emerging country markets involve greater risk and volatility than more developed markets. Some emerging markets countries may have fixed or managed currencies that are not free-floating against the U.S. dollar. Certain of these currencies have experienced, and may experience in the future, substantial fluctuations or a steady devaluation relative to the U.S. dollar.
